

MUGG & BEAN

ON THE★MOVE

★ NUTRITIONAL INFORMATION ★

Giving you more information about your favourite meals

Mugg & Bean is proud to share the nutritional analysis of our menu with you. A calculated analysis using databases like the South African Food Composition Database (SAFOOD) ensures the accuracy of all information included. Here's what we found.

Energy

All energy required by the body must be supplied by food and beverage intake. Recommended energy intakes vary according to gender, age and activity. The total food energy intake should, however, facilitate healthy growth and development, the body's many functions and healthy physical activity.

Carbohydrates, proteins and fats are all energy providing nutrients. Note that our major source of energy should come from carbohydrates, however, our bodies need protein and energy from fat for good health.

The unit for measuring energy is the kilojoule (kJ) or the kilocalorie (kCal).

Carbohydrates

Carbohydrates are our bodies' preferred source of energy. For meals to be high in carbohydrates they must have at least 13g of carbohydrates per 100g serving.

Dietary Fibre

Dietary fibre is also referred to as roughage and is generally of plant origin. It is an essential part of any diet, adds bulk to foods, slows down your digestion and helps you feel satisfied. It also keeps your tummy healthy and regular.

Foods high in fibre usually require a bit more chewing, contribute to satiation, and promote better dental health. If your meal has three (3)g or more grams of fibre for every 100g serving, it's a good source of fibre.

Proteins

Proteins are made up of amino acids and their function is to help build, maintain and repair body tissue. Amino acids are the basic building blocks of enzymes, hormones, proteins and body tissue.

Sources of protein in food include meat, poultry, fish, eggs, milk, cheese, yoghurt, soya, legumes (e.g. dried beans, split peas, lentils and chickpeas), seeds and nuts. Grain products and numerous vegetables also supply small amounts of protein.

All protein is made up of amino acids. The body needs 22 amino acids, of which 8 are essential, meaning they cannot be manufactured by the body and need to be supplemented through diet. Protein quality depends on the amount of essential amino acids contained in a meal. Foods derived from animals (e.g. fish, poultry, meat, egg and milk) are high-quality proteins and contain all the essential amino acids.

All plant foods, except for soya and quinoa, are incomplete proteins as they lack sufficient amounts of one or more of the essential amino acids. Interesting to note, if two incomplete proteins are properly combined, they become complementary proteins and make up a complete protein.

Total Fat

Fat is a concentrated source of energy.

Fats have various functions in the body:

- Protecting the body's organs and nerves from injury by holding them in position
- For insulation and helping to maintain body temperature
- Supplying the essential fat-soluble vitamins A, D, E & K
- Transporting and absorbing fat-soluble vitamins
- Delaying the emptying time of the stomach
- Adding to the taste and palatability of the diet

(a) POLYUNSATURATED FAT

A beneficial fat that is found primarily in plant foods (e.g. sunflower oil).

(b) MONOUNSATURATED FAT

A beneficial fat that is also found primarily in plant foods. They are usually liquid at room temperature (e.g. olive oil).

(c) SATURATED FAT

Saturated fat is usually solid at room temperature. Found mostly in foods derived from animals, such as fatty meat, poultry skin and full-cream dairy products. It can increase your LDL (bad) cholesterol levels which may increase your risk of heart disease. It is advisable to limit your intake of saturated fat.

(d) TRANS FAT

Trans fats have been associated with an increase in bad cholesterol and a simultaneous decrease in good cholesterol in the body. Because of this, food manufacturers have endeavoured to lower trans fats in foods. It is advisable to limit your intake of trans fat.

Why that matters?

Hydrogenated fats are formed when food manufacturers add hydrogen atoms to unsaturated fats to make them more saturated, more solid, and shelf-stable. This raises your body's bad cholesterol and lowers the good cholesterol.

Cholesterol

When you eat too many foods that are high in saturated fats and cholesterol (mostly animal products) it can make your blood cholesterol levels rise. A high intake of saturated fat, trans fat and cholesterol in food can raise your bad blood cholesterol.

Sodium

Sodium is an essential mineral that stabilises your body fluids. Sodium is found in table salt and in many processed foods.

The recommended table salt intake is no more than 5g (1 teaspoon of salt/day) or 2,400mg of sodium/day.

The Importance of Portion Size

As we get older, our perception of what constitutes a healthy portion of food slowly increases. As a result we eat more. Increasing one's portion size is one of the most common ways extra kilojoules sneak into our diet because often we don't realise we are actually eating more than we should. When you feel your portion is too big, try save the rest for later.

kJ = Kilojoules

g = grams

Carbs = Carbohydrates

Ttl fat = Total Fat

Sat Fat = Saturated Fat

Ttl Sodium = Total Sodium

Hints, Tips & Guidelines for Healthy Eating

1. Enjoy a variety of foods
2. Drink lots of clean water
3. Make starchy food part of most meals
4. Eat plenty of vegetables and fruit everyday
5. Eat dry beans, split beans, lentils and soya regularly
6. Fish, chicken, lean meat or eggs could be eaten daily
7. Have milk, maas or yoghurt every day
8. Use fat sparingly and choose vegetable oils rather than hard fat
9. Use salt and foods high in salt sparingly
10. Use sugar and food and drinks high in sugar sparingly
